How I would split work across ChatGPT, Enterprise GPT, Claude, Gemini, and Grok

The important warning: **do not use five models as five equal cofounders.** That creates reconciliation overhead and wastes the weekend.

Use one as conductor, two as specialists, one as critic, and one as the shared workspace.

ChatGPT / GPT-5.4 Pro

Use this as the **conductor** for product decisions, synthesis, final copy, PRDs, and structured implementation plans. OpenAI positions GPT-5.4 as its most capable professional-work model, with coding, search, tool use, computer-use capability, and up to a 1M-token context window.

Give it:

- positioning memo
- landing page copy
- Trip Mode PRD
- final synthesis after other models disagree

ChatGPT Enterprise

Use this as the **project hub**, not as a separate intelligence. OpenAI describes ChatGPT Enterprise as a plan with enterprise-grade security/privacy and tools like projects, apps, deep research, data analysis, files, search, and more. Projects can group chats/files, and Business/Enterprise/Edu can share projects with teammates.

Give it:

- all docs and drafts
- the source-of-truth project
- shared task lists
- any connected-workspace retrieval if you have it

Claude

Use Claude for the **repo-aware engineering pass**. Anthropic's current materials emphasize long-running coding tasks, code review/debugging, large-codebase reliability, and a 1M-token context window for Opus 4.6 and Sonnet 4.6, plus Claude Code for longer development tasks in terminal/IDE workflows.

Give it:

- repo audit
- data model review
- migration safety review
- component refactor plan
- "find the hidden edge cases in Trip Mode and weight logic"

Gemini

Use Gemini for **travel UX, mapping/timezone thinking, and long-context docs/tools work**. Google's current materials position Gemini 3.1 Pro for complex problem-solving and software engineering, with 1M context, Search/Maps/URL/Code Execution/Computer Use tools, plus Canvas and Gems for structured collaboration.

Give it:

- timezone-aware Trip Mode flows
- travel user journeys
- map/location-influenced ideas
- structured UX docs
- alternative onboarding concepts

Grok

Use Grok as the **aggressive critic and launch-angle generator**. xAI's current docs position Grok with real-time search, advanced reasoning, tool use/function calling, structured outputs, and a very large context window in the API/docs.

Give it:

- "destroy this positioning"
- "what would X/Twitter fitness people mock here?"
- "what are the sharpest launch hooks?"
- "what is pseudo-scientific sounding about this?"

That is where Grok is useful: not as your PM, but as your contrarian.
